snapcraft

name: timesink

version: 0.1

summary: NTP server with GPS support

description: |

A snap that uses your GPS to provide a long-term accurate time service with NTP. If your GPS provide a "pulse per second" (PPS) signal, then the time can be accurate to microseconds.

Data can be difficult

And potentially a liability

Security can be even more difficult!

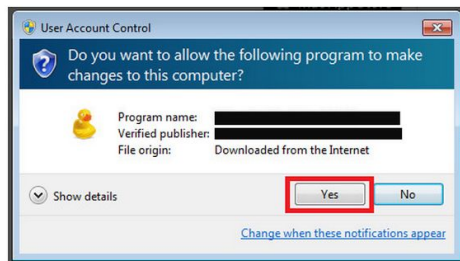

## RISK ASSESSMENT / SECURITY &amp; HACKTIVISM

## In blunder threatening Windows users, D-Link publishes code-signing key

Leak of private key could give malware easier entry onto Windows computers.

by Dan Goodin - Sep 18, 2015 6:15pm BST

69

In a ham-fisted move that threatens computer users everywhere, developers at router manufacturer D-Link published a private cryptography key used to certify that software is trustworthy and not malware, a security researcher said.

The software signing key was released in late February on D-Link's GPL source code sharing website, along with the source code from some of the company's firmware. Yonathan Klijnsma, a threat intelligence analyst at Dutch security firm Fox IT, told Ars in an e-mail. D-Link used the key to cryptographically sign its software so it could be installed on computers running Microsoft Windows without the operating system generating a security warning. With it leaked to the world, anyone—including developers of keyloggers, remote access trojans, and other types of malware—could use the key to sign their malicious wares so they're accepted as trusted D-Link software.

It's not unusual for malware providers to steal or otherwise appropriate valid signing keys to give their wares the appearance of legitimacy. Stuxnet, the computer worm jointly developed by the US and Israel to sabotage Iranian nuclear centrifuges, was among the early pieces of malware to be signed this way. Since then, code signing has become almost standard practice among upper-tier malware distributors. Normally, malicious developers must hack a legitimate certificate holder and acquire the underlying private key. D-Link, it seems, may have saved bad guys this extra step by openly publishing its signing key and allowing it to remain online for seven months. The story was [reported earlier by Tweakerts](#).

The key expired earlier this month, but Klijnsma said that any software that was signed before the

Linux.Wifatch: A force for good or evil?

By [Charlie Osborne](#) for [Zero Day](#) | October 2, 2015 -- 10:56 GMT (11:56 BST) | Topic: [Security](#)

*Symantec*

Researchers are puzzling over the Linux.Wifatch malware -- sophisticated code which appears to help secure IoT devices, and yet also forces infected devices to a peer-to-peer network of infected systems.

On Thursday, Symantec researchers [revealed their research](#) into the activity of Wifatch, a peculiar piece of code which does not replicate the usual activities of malware such as bricking systems, conducting surveillance or stealing data.
