Drones flying safely in public spaces

Project goal

Can drones fly in a busy area with a clear mission but without hitting each other?

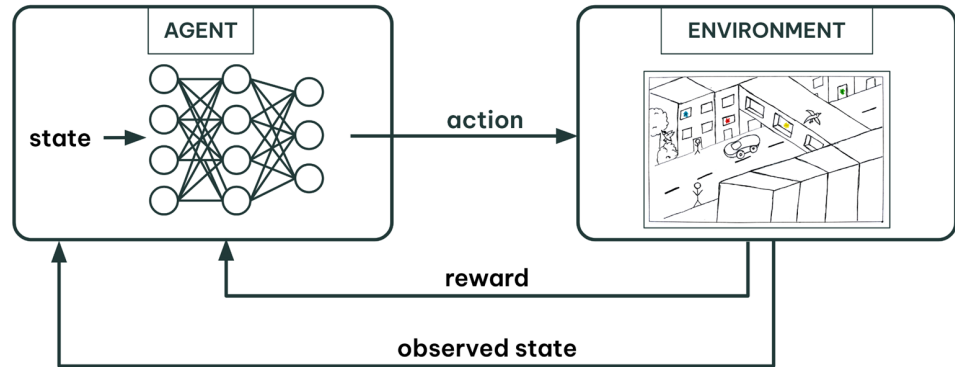

This project is taking the first steps towards drones being able to fly over busy public areas safely .

See how effectively we can use realistic simulations and a selected toolset for this purpose .

Project approach

- Reinforcement Learning
- Deep Q- learning

Technologies

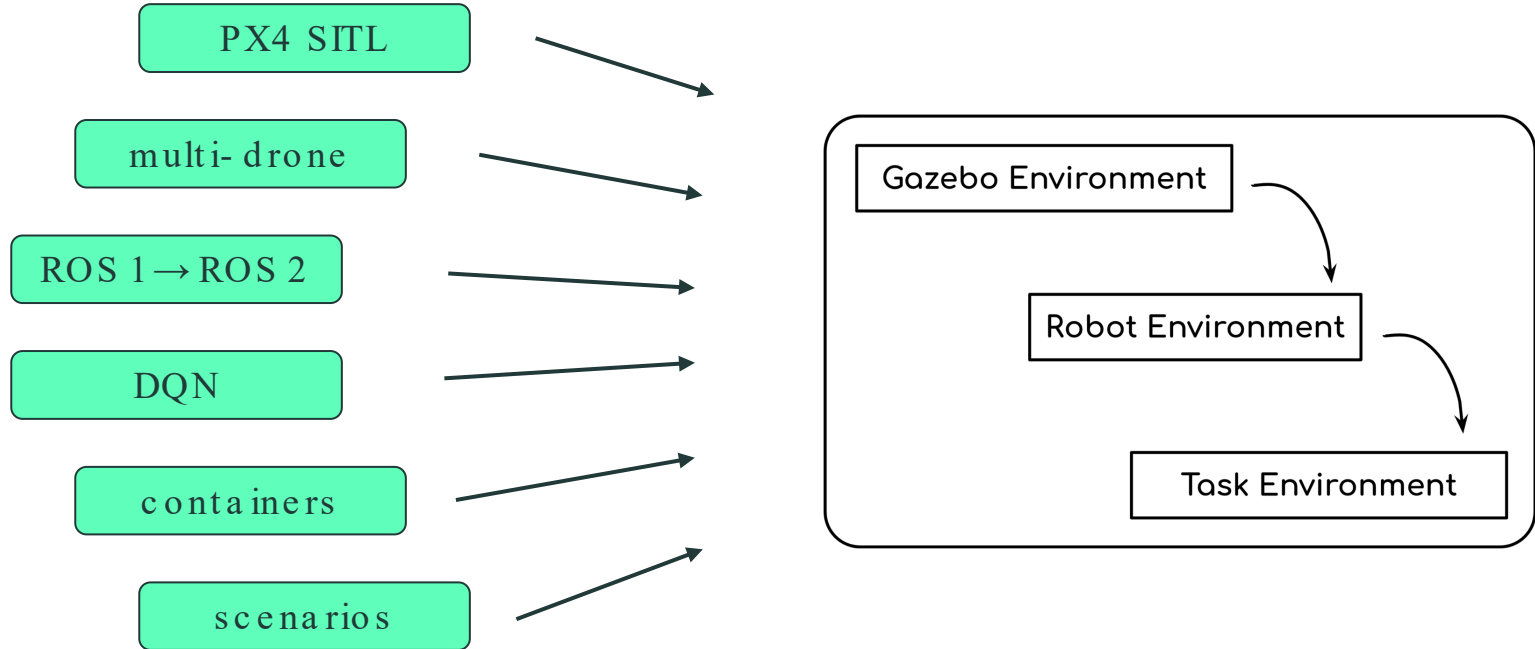

- The Construct: openai_ros
- ROS 1/ ROS 2
- Gazebo Classic
- PX4 SITL
- Blender
- PyCharm Community Edition

Software setup

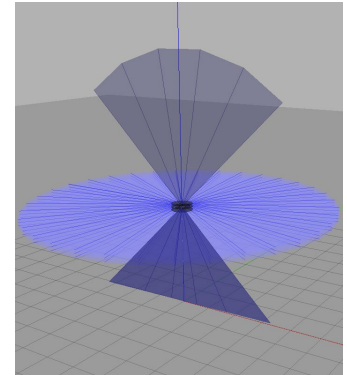

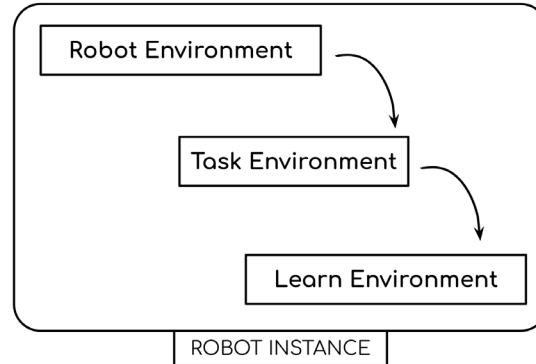

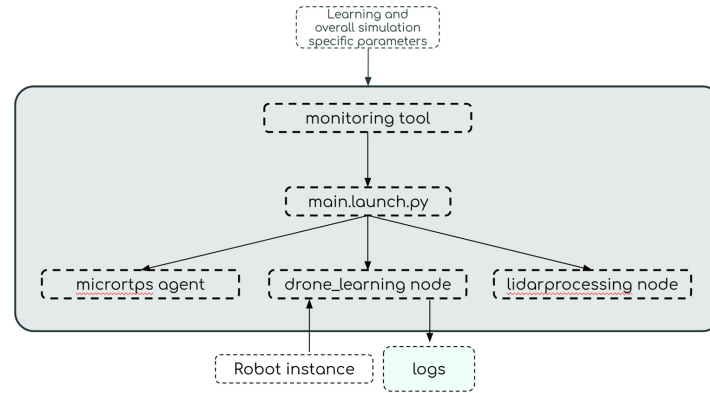

Software setup

Software setup

Project outcomes

- Scenarios and rules
 - Positive results for simple scenarios
 - Cooperation

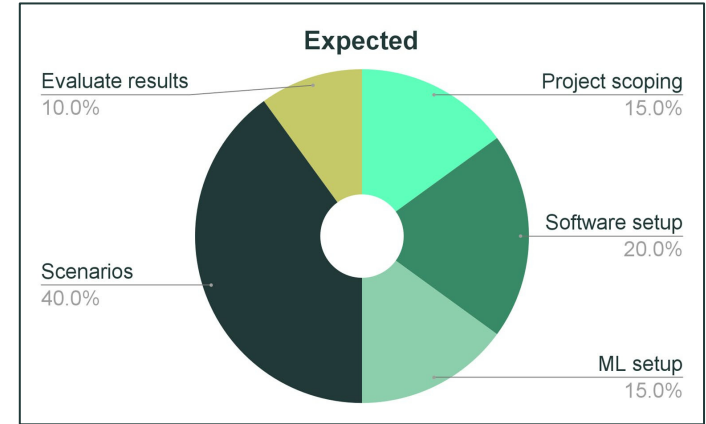

Project outcomes

- Benefits

- Working setup
- Learnt scenarios
- Open source

- Difficulties

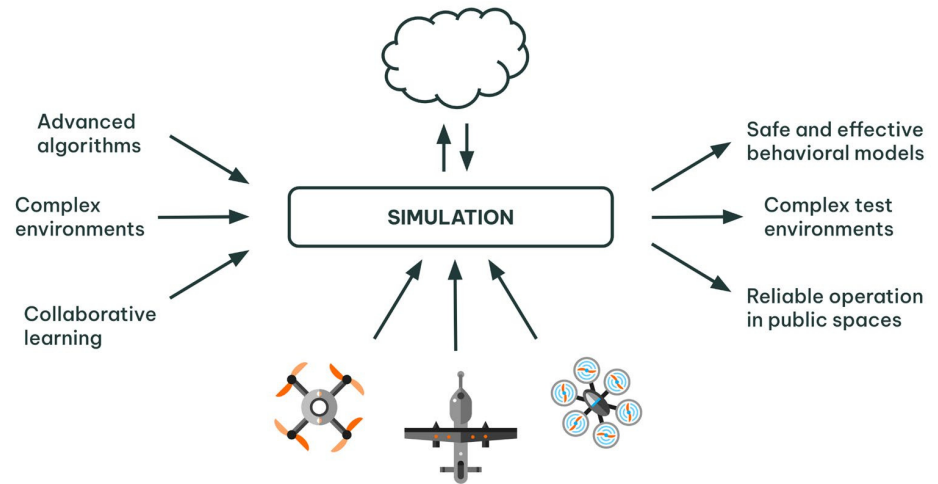

- Longer time to set up than expected
- Low simulation speed
- Instability

Next steps

- Giving back
- Cloud based infrastructure
- Increase number of drones
- Drones with different configurations
- More complex algorithms
- Variable realism
- More environments

Thank you!
