

SpatialVision: Bringing Popping-Out RViz to Life with AirPods

Yoshito Okada (Tohoku Univ., Japan)

About Me: Yoshito OKADA

- Project Associate Professor, Tohoku University, Japan
-  yoshito-okada

Search and Rescue robots
[Okada+, IROS2010]

Bridge inspection drones
[Mizutani+, IROS2013]

Tracked vehicle simulation
[Okada+, ICRA2020]

ROSCon2023

Overlaid fiducial markers
[Okada+, ICRA2021]

Today's topic: Stereoscopic system **SpatialVision**

Stereoscopic System (SS) is useful

Surgical robots
often employ SS
[Nam+, 2012]

SS expedited UGV's movement
through tight spaces
[Chen+, 2010]

SS reduced collision
with surroundings
[Luo+, 2021]

Would also be useful in design

But SS can be bulky & costly

Display

Projectors

LC shutter gl. + disp.

Polarized gl. + disp.

Lenticular display

HMD

Standard display

MoCap

Oculus, HTC

VSLAM

Face track camera

Head tracking

IMU

None

SpatialVision aims low complexity & cost

Hardware: AirPods + iPhone + PC

iPhone

forwards head pose
to PC

AirPods

tracks head with built-in IMU

PC (RViz)

aligns Rviz's camera angle
with head pose

→ **Feels 3D due to
the motion parallax**

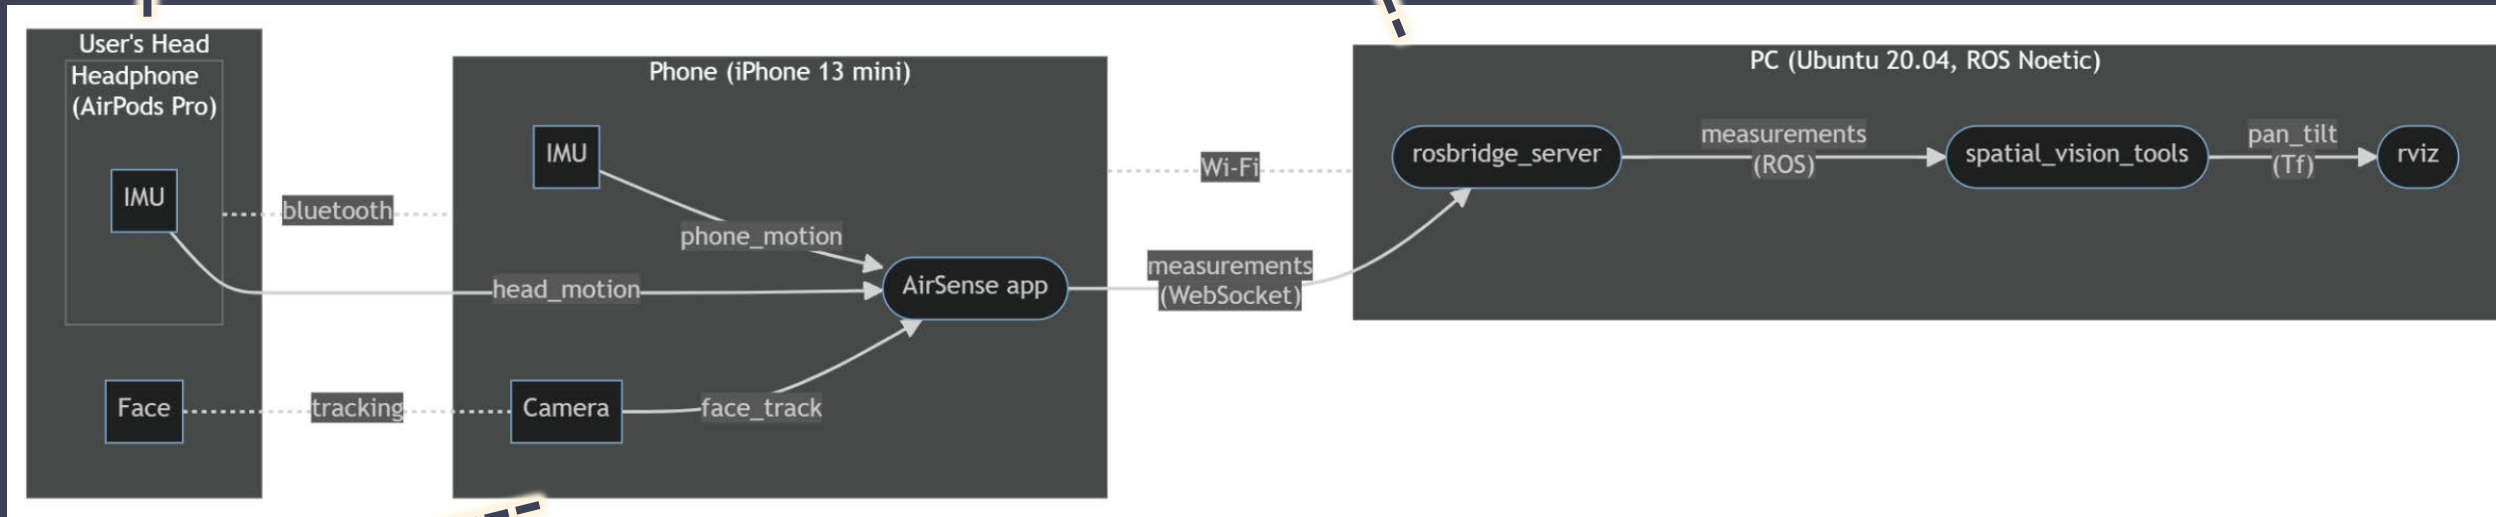

Software: iOS app + ROS 1/2

- Built-in IMU
(AirPods Pro Gen 2, etc. originally for spatial audio)

- Camera pose binding to a Tf frame
(FrameAligned mode)

- Access to AirPods IMU via API (Core Motion. iOS14 or later)

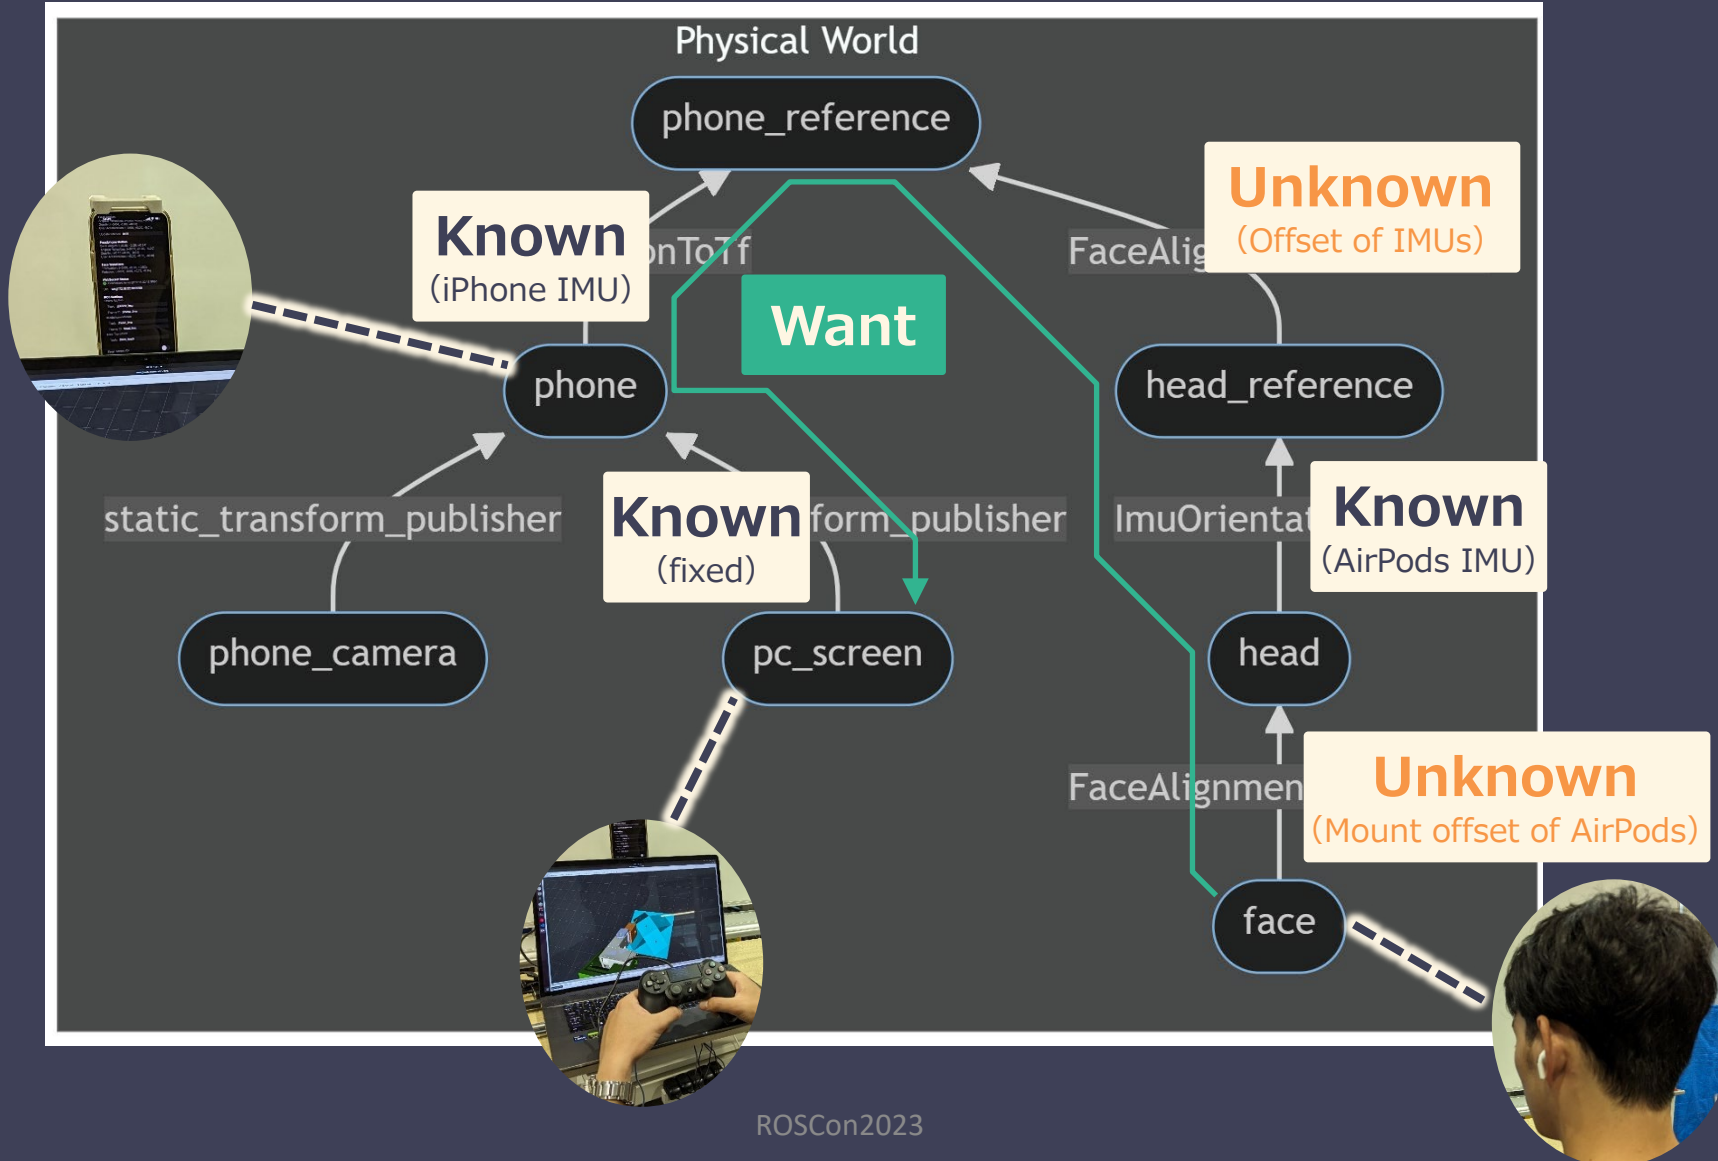

What if **iOS app** that streams AirPods IMU to **Tf** ?

- iOS15 or later
- ROS1/2
(requires rosbridge)
- AirPods IMU
- iPhone IMU
- Face track
by front cam
- Useful as
a standalone app
(MagSafe attachable IMU
that can stream
via WiFi or mobile)

Tf handles pose between PC & user

Calibrate “Unknown”s in 10 seconds

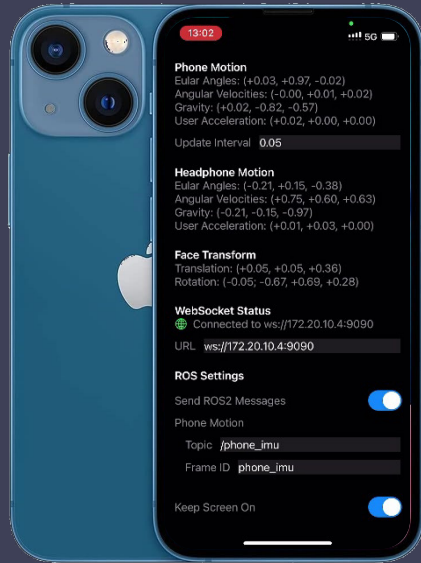

- Estimate unknown offsets by matching head track with the iPhone’s front cam
- No camera required once calibrated
→ works out of FOV or in a public place
- ROS1 Noetic or ROS2 Humble

SpatialVision finally works!

Stars / Issues / PRs are welcome!
